PROFESSIONAL SUMMARY

Software Developer with 1.5 years of experience building scalable backend systems using Java and Spring Boot, along with modern frontend applications using ReactJS. Skilled in Shopify app development, MySQL, Redis, Elasticsearch, and queue-based architectures using Apache Artemis. Delivered a custom Punchout integration that replaced a paid third-party service, integrated OpenAI's API for automated e-commerce content generation, and built customer-facing engagement features that improved on-site experience for 15K+ monthly users.

SKILLS

Languages: Java.

Frameworks: Spring Boot, ReactJS.

Databases/Cache: MySQL, Redis.

Messaging/Search: Apache Artemis, Elasticsearch.

E-Commerce: Shopify Apps.

Hosting: Cloudflare.

AI/LLM: OpenAI API Integration, Prompt Engineering, AI-Assisted Content Generation.

WORK EXPERIENCE

Software Developer, JBPB Offshore Private Ltd. (Formerly Hikeon Technologies) – Feb 2025 – Present
Bangalore

- Designed and developed backend services in Java/Spring Boot for e-commerce and B2B integration platforms, using MySQL, Redis, and Elasticsearch for storage, caching, and indexed search.
- Built an in-house Punchout Portal with cXML/XML transaction handling and Apache Artemis-based async queue processing, eliminating a paid third-party Punchout Cloud subscription (saving an estimated \$15000/year) while connecting to Birchstreet, Microsoft D365, and other portals.
- Built "Notify Me" and "Wishlist" customer engagement modules (ReactJS + Spring Boot + Elasticsearch), driving 10% of restocked-item sales and increasing repeat visits by 15%.
- Integrated OpenAI's API to auto-generate product, collection, and blog/article content with prompt templates and a merchandiser approval workflow, cutting manual content-writing effort by 60% and new listing turnaround from 3 days to 4 hours.

PROJECTS

CommercePlex – E-Commerce Microservices Platform

- Designed and built an 8-service e-commerce microservices platform – Auth, Catalog, Order, Payment, Inventory Sync, Notification, AI Content Generation, and Search – communicating asynchronously via Apache Artemis instead of direct service-to-service calls.
- Built Auth (JWT-based, role-based access control), Catalog, and an Order Service with a state-machine lifecycle (placed → paid → shipped → delivered/cancelled) backed by a Payment Service with idempotent processing for duplicate/retried payments.
- Built an Inventory Sync Service using Redis-based distributed locking to prevent overselling, a Notification Service publishing order alerts via Artemis, and an AI Content Service (OpenAI-powered, human-in-the-loop approval).
- Built a Search Service using Elasticsearch, kept in sync via real-time events; containerized all services with Docker Compose behind a single API Gateway for independent deployability and fault isolation.
- Followed a database-per-service pattern with versioned event schemas (e.g. OrderPlaced, PaymentCompleted, StockUpdated) to keep services independently deployable without tight coupling.
- Wrote integration tests per service and contract-style API tests to validate event producer/consumer behavior across service boundaries before deployment.
- Tools Used: Java, Spring Boot, Apache Artemis, Redis, MySQL, Elasticsearch, OpenAI API, JWT, Docker.

EDUCATION

K.S. Rangasamy College of Technology, B.Tech - Information Technology

Oct 2021 – May 2025

- CGPA: 7.80/10.0
